

Extreme Value Analysis – Tmax

| Metric | Value |
|------------------------|-----------------------------------|
| Distribution | Generalized Extreme Value (GEV) |
| GEV Type | Weibull-type (bounded upper tail) |
| Number of Blocks | 80 |
| Observations per Block | 365 |
| μ (location) | 37.665 |
| σ (scale) | 2.441 |
| ξ (shape) | -0.198 |

| Return Period (yrs) | Return Level |
|---------------------|--------------|
| 50 | 44.30 |
| 100 | 45.03 |

Interpretation: The **GEV** distribution fitted to annual block maxima indicates a **Weibull-type (bounded upper tail)** behavior. Optimal POT threshold $q=0.95$ based on minimum bootstrap uncertainty. Rolling POT shows no significant trend in $\xi(t)$ (slope=0.0002). Mann-Kendall $p=0.872$, Pettitt $p=1.329$. Return levels for [50, 100] yrs calculated.
